

1    **ABSTRACT OF THE DISCLOSURE**

2            A flexible LED cable light has a flat insulation body, at least two wires  
3    embedded in parallel in the insulation body, multiple LEDs connected in  
4    parallel electrically to the two wires and a protective layer covering the  
5    insulation body. Each wire has high flexibility, good conductivity and large  
6    current-resistant that is suitable to decorate over long distances. Furthermore,  
7    segments of the cable light can also be connected to another segment by a  
8    connector so the present invention is waterproof, inexpensive, cuttable, joinable,  
9    etc.
